RajuERP: what every section is for

A short guide to every menu, how to use it, and how the parts work together. All names and amounts in the examples are fictional.

Words used in this guide

Term	Plain meaning
SKU	Your own unique code for a product, for example MP-200.
Batch	One production lot of a product, with a batch number, manufacturing date and expiry date printed on the pack. Stock is tracked per batch.
Base unit / pack unit / pack size	Base unit: the smallest unit you count (Piece). Pack unit: the bigger pack you buy or ship (Case). Pack size: how many base units are in one pack (10). **1 Case = 10 Pieces**.
Stock bucket	Where units in a batch sit: **Saleable** (can be dispatched), **Damaged**, **Expired** or **Inspection** (waiting for a decision).
GST, CGST/SGST, IGST	GST is the tax added to the price. Same-state sales split it into CGST + SGST; sales to another state carry IGST. Prices in the system are **before** GST.
HSN code	A standard goods-classification number printed on invoices. Optional here; ask your accountant for the right one.
Receivables / Payables	Receivables: money distributors owe you. Payables: money you owe suppliers.
Credit note / debit note	Credit note: reduces what a distributor owes (for example after a return). Debit note: increases it.

How it all works together

The example used throughout: a packaged snack, **Masala Peanuts 200g** (SKU MP-200), brand *Greenleaf*, category *Snacks › Namkeen*, sold as Pieces and bought in Cases of 10. Supplier: *Shree Ganesh Foods* (Karnataka). Distributor: *Kaveri Distributors* (Tamil Nadu). Your company state (Settings) is Karnataka.

#	Step and menu	Why	Example and what happens next
1	**Master data**: Products → Units & packaging, Brands, Categories	A product needs a unit, brand and category to choose from.	Units Piece and Case; brand Greenleaf (Own); category Snacks with subcategory Namkeen.
2	**Product**: Products → Product master → Add product	Everything else refers to the product.	MP-200, base unit Piece, pack unit Case, pack size 10, buy ₹40, sell ₹55, GST 12%. **No stock yet.**
3	**Supplier**: Purchases → Suppliers	Chosen on each purchase order.	Shree Ganesh Foods, state Karnataka. (A product does not need a supplier.)
4	**Purchase order**: Purchases → Purchase orders → New	Records what you asked the supplier to send.	100 Pcs at ₹40 + 12% GST = ₹4,480.00. Use **Save & mark ordered**. **Stock does not change.**
5	**Receive goods**: Purchases → Goods receipts → Receive goods	Records what really arrived. **This is when stock goes up** and batches are created.	Receive 80 (batch MP-261014-A, expiry date) then 20 (batch MP-261020-B). Order becomes Partially received, then Received. Stock = 100 Pcs (10 Case).
6	**Verify**: Inventory → Stock overview, Batches & expiry, Stock movements	Confirm the receipt did what you expected.	Two batches with 80 and 20 saleable units; two Receipt movements; Payables shows ₹4,480.00 owed.
7	**Distributor**: Distribution → Distributors & dealers (and Pricing & terms)	You need the customer's state and credit terms.	Kaveri, Tamil Nadu, credit limit ₹50,000, 30 credit days, special price ₹55 with 2% discount. Different state, so **IGST**.
8	**Order and dispatch**: Distribution → Orders, then Dispatches	The order records the request; the dispatch sends the goods.	Order 60 Pcs and confirm (no stock change). Dispatch: batches are suggested earliest expiry first. **Stock −60 → 40 left.**
9	**Invoice**: tick "Generate invoice after dispatch", or Sales → Invoices → Generate invoice	Bills the distributor. An invoice is always made from a dispatch. It does **not** change stock.	Taxable ₹3,234.00 + IGST ₹388.08, round-off −₹0.08 = **₹3,622.00**, due in 30 days. Kaveri now owes ₹3,622.00.
10	**Payment**: Accounts → Payments received → Record payment	Records money received and applies it to the invoice.	₹2,000.00 allocated: invoice **Partial**, ₹1,622.00 outstanding.
11	**Return**: Sales → Sales returns → Record return	Goods came back. Stock and the amount owed are corrected.	5 packets damaged: classify **Damaged** → they do not return to sellable stock. Credit note ₹301.84 → outstanding ₹1,320.16. Then pay ₹1,320.16 → **Paid**.
12	**Reports**: Dashboard, Alerts, Reports	Check that everything agrees.	Stock 40 saleable + 5 damaged; receivables ₹0.00; sales revenue ₹2,964.50 (₹3,234.00 less the return ₹269.50).

IMPORTANT

When does stock change? Up: goods receipt, sales return (saleable), approved stock count. Down: dispatch, write-off, supplier return. **Not** by: purchase orders, distribution orders, invoices, credit notes or payments.

What to do when goods are returned

Condition of the returned goods	Choose this on the return	What happens to stock	What to do next
Good and resellable	**Saleable**	Added back to sellable stock.	Nothing; they can be dispatched again.
Damaged	**Damaged**	Held in the damaged bucket; not sellable.	Later: write off (Inventory) or return to the supplier.
Past expiry	**Expired**	Held in the expired bucket.	Record a write-off under Expired write-offs.
Not sure yet	**Needs inspection**	On hold; not sellable.	After checking, open the return → **Decide disposition** (Saleable, Damaged or Expired). The decision is final.

Tick **Issue credit note for returned goods** (on by default) to reduce what the distributor owes. A return cannot be larger than what was invoiced, and a return cannot be edited or deleted after saving.

1. Dashboard

Overview → Dashboard. Opens first after sign-in; every role can see it. All numbers are calculated live from your records.

Card	What it means	Click opens
Stock value (saleable, at cost)	Sellable units in unexpired batches × their batch cost.	Stock valuation
Sales this month (excl. GST)	Invoice value before GST this month, compared with last month. Returns are **not** subtracted.	Sales report
Purchases this month (excl. GST)	Goods **received** this month (not orders), before GST.	Goods receipts
Collections this month	Payments received from distributors this month.	Payments received
Receivables outstanding	What distributors owe you; the hint shows how much is overdue.	Receivables
Payables outstanding	What you owe suppliers.	Payables
Expiry alerts	Batches expiring soon plus expired batches.	Alerts
Low-stock products	Active products below their minimum stock; hint shows open orders waiting for dispatch.	Stock overview

Charts and lists: “Sales, purchases and collections” (last 6 months), “Sales by brand” and “Top distributors” (last 3 months, with what they owe), and lists of recent invoices, overdue invoices, expiring or expired batches and low stock. Each list has **View all**.

Important: nothing is changed from the Dashboard; it only reads data. “This month” cards use the current calendar month only.

2. Alerts

Overview → Alerts, or click the bell in the header (the red number is the total of all open alerts). Alerts are worked out live and disappear when the problem is fixed; there is nothing to dismiss.

Alert tab	Why it appears	What to check or do
Expiry (expired / expiring soon)	A batch has passed its expiry date, or expires within 30 days (red) or within the alert window in Settings, default 90 days (amber).	Sell or return the stock first; use the row menu **Write off** for expired stock.
Low stock	An active product has fewer saleable, unexpired units than its Minimum stock (or none).	Row menu **Create purchase order**, or correct the minimum.
Overdue payments	An invoice has an amount outstanding and its due date has passed.	**Record payment** if money arrived; otherwise follow up the distributor.
Credit limit	A distributor's balance is above its credit limit.	**View ledger**; collect payment or review the limit.

Alert tab	Why it appears	What to check or do
Pending inspection	A sales return line was marked “Needs inspection”.	Open Sales returns and **Decide disposition**.

3. Products

Set up in this order: Units → Brands → Categories → Product master. A product needs all three to exist first. A supplier is **not** part of a product.

Units & packaging

Products → Units & packaging (tabs: Units, Conversions)

Purpose: Lists the units you count and pack in (Piece, Kg, Case). Stock is always counted in each product's **base unit**.

How to use it:

1. Units tab → **Add unit**: type the Unit name and a Short code.
2. Optional: Conversions tab → **Add conversion**, for example 1 Case = 10 Pieces.

Example: Units *Piece (Pcs)* and *Case (Case)*. On the product, set Pack size 10, so 100 Pcs displays as “100 Pcs (10 Case)”.

Important: Conversions are a reference list only; the system does not use them to convert quantities. What matters is the **Pack size** on each product.

Brands

Products → Brands

Purpose: Keeps your own brands separate from third-party brands; the Brand-wise report compares them.

How to use it: Add brand → type the name → choose **Own brand** or **External brand** → save.

Example: Brand *Greenleaf*, type Own brand.

Important: Create the brand **before** the product, or it cannot be selected. A brand with products cannot be deleted; untick **Active** instead.

Categories and subcategories

Products → Categories

Purpose: Groups products. A subcategory sits under one category (two levels only).

How to use it: Add category → name. To make a subcategory choose a **Parent category**.

Example: Category *Snacks*; subcategory *Namkeen* with parent Snacks.

Important: Create categories before products. On the product, the subcategory must belong to the chosen category.

Product master

Products → Product master → Add product

Purpose: The list of everything you buy and sell, with pricing, GST and packaging.

How to use it: Click **Add product**, fill the fields below, and save. Edit later from the row menu.

Example: MP-200 Masala Peanuts 200g, base unit Piece, pack unit Case, pack size 10, minimum stock 30, buy ₹40, sell ₹55, GST 12%, HSN 2008 (illustrative).

Important: Creating a product adds **no stock**. Prices are **before GST**. A product that has been used cannot be deleted; untick **Active**.

Field	Meaning	Field	Meaning
SKU *	Unique product code.	Pack size *	Base units in one pack (use 1 if none).
Product name *	Name shown everywhere.	Minimum stock *	Below this the product shows as Low stock.
Brand *, Category *	Chosen from the lists you created.	Purchase price *	Cost per base unit, before GST (default rate on purchase orders).
Subcategory	Optional.	Selling price *	Standard price per base unit, before GST (default on orders).
Base unit *	Unit stock is counted in.	GST rate *	0%, 5%, 12%, 18% or 28%.
Pack unit *	The bigger pack, e.g. Case.	HSN code, Active	HSN is optional; Active controls whether it can be used.

* required

4. Inventory

Stock is never typed in. Every change is a **stock movement**, and a batch's quantity is the total of its movements. Batches are created only when goods are received.

Stock overview

Inventory → Stock overview

Purpose: Current stock per product across all batches.

How to use it: Use the filters (brand, category, stock level) and the row menu **View batches** or **Create purchase order**.

Example: MP-200: available 40 Pcs (4 Case), damaged 5, status In stock.

Important: Available = saleable units in batches that have not expired. Damaged, expired and inspection units are shown in their own columns.

Batches & expiry

Inventory → Batches & expiry

Purpose: Each batch with manufacturing and expiry dates, days to expiry, quantity per bucket, unit cost and value.

How to use it: Use the expiry chips (Expired, Expiring ≤ 30 days, Expiring soon, OK); row menu **Write off** or **View movements**.

Example: Batch MP-261014-A: 20 saleable, 5 damaged, expires in a year.

Important: You cannot add or edit batches here. A batch cannot be dispatched after its expiry date.

Stock movements

Inventory → Stock movements

Purpose: The full history of every stock change, with its document number.

How to use it: Filter by type (Receipt, Dispatch, Sales return, Supplier return, Adjustment, Write-off, Reclassification), bucket and period.

Example: +80 Receipt (GRN-2026-0001), −60 Dispatch (DSP-2026-0001), +5 Sales return (damaged).

Important: Read-only. Use it to trace why a quantity is what it is.

Stock valuation

Inventory → Stock valuation

Purpose: The value of stock using **FIFO** (oldest bought assumed sold first) or **Weighted average** cost.

How to use it: Choose FIFO or Weighted average at the top; the default is set in Settings.

Example: 40 saleable Pcs bought at ₹40 are valued at ₹1,600.00; 5 damaged Pcs are shown as held value ₹200.00.

Important: It can differ from Stock overview value because valuation includes saleable units in expired batches.

Expired write-offs

Inventory → Expired write-offs

Purpose: Removes expired or unusable stock from the books, with a reason.

How to use it: Record write-off (or **Write off all expired**) → choose batch, stock bucket and quantity → add a reason → save.

Example: Write off 20 expired units of a batch: value 20 × ₹40 = ₹800.

Important: Reduces stock permanently; it cannot be undone.

Reconciliation (stock count)

Inventory → Reconciliation → New stock count

Purpose: Compares the system's saleable stock with a physical count and posts the difference as an **adjustment** (the only way to adjust stock).

How to use it: Add batches, enter the **Physical count** for each, **Save as draft**, then open it and **Approve & adjust stock**.

Example: System 20, counted 19: approving removes 1 unit with an Adjustment movement.

Important: A draft changes nothing. Approval cannot be undone. Only the saleable bucket is counted.

5. Purchases

> **IMPORTANT**
> **A purchase order does not increase stock.** It is only a request to the supplier. Stock is added when you record a **Goods receipt** for goods that actually arrived. Saving, marking as ordered, editing or cancelling a purchase order never moves stock.

Suppliers

Purchases → Suppliers

Purpose: Directory of the companies you buy from.

How to use it: Add supplier → Supplier name and State (required); GSTIN, contact details optional.

Example: Shree Ganesh Foods, Karnataka.

Important: A supplier with orders or payments cannot be deleted; untick Active.

Purchase orders

Purchases → Purchase orders → New purchase order

Purpose: Records what you ordered, with rates and GST.

How to use it: Choose supplier and date → **Add product** (rate and GST fill from the product; enter quantity) → **Save as draft** or **Save & mark ordered**.

Example: 100 Pcs of MP-200 at ₹40 + 12% GST = ₹4,480.00.

Important: Only **Ordered** or Partially received orders can be received. Once anything is received the order can no longer be edited or cancelled, so check the rate first.

Goods receipts

Purchases → Goods receipts → Receive goods

Purpose: Records goods that arrived; **adds saleable stock** and creates or tops up batches.

How to use it:

1. Choose the open purchase order and receipt date, enter the supplier invoice number.
2. For each product enter **Qty received**, **Batch no**, **Mfg date** and **Expiry date** (quantity 0 skips a line).
3. Click **Record receipt**.

Example: Receive 80 of 100 (batch MP-261014-A), later the other 20 (batch MP-261020-B): the order goes Partially received, then Received.

Important: Cannot receive more than pending. The receipt uses the order's rate. Receipts cannot be edited or deleted. What you owe the supplier rises by the receipt total.

Supplier returns

Purchases → Supplier returns → New supplier return

Purpose: Sends goods back to a supplier (damaged, expired, short-dated).

How to use it: Choose supplier and reason → add batch, stock type and quantity → **Record return**.

Example: Return 5 damaged units: credit ₹200.00 + ₹24.00 GST = ₹224.00.

Important: Reduces stock in the chosen bucket and reduces what you owe the supplier. It does not reopen the purchase order.

6. Distribution

Dispatched means goods you sent. It is **not** the distributor's sales: the system knows a distributor's sales only from reports you enter under Distributor stock.

Distributors & dealers

Distribution → Distributors & dealers

Purpose: Customer directory with state, GSTIN, **credit limit** (a warning level) and **credit days** (days allowed to pay).

How to use it: Add distributor → Name and State (required); a code such as D001 is created if left blank; set credit limit and days.

Example: Kaveri Distributors, Tamil Nadu, limit ₹50,000, 30 days.

Important: The State decides CGST + SGST or IGST on invoices. A distributor with orders, invoices or payments cannot be deleted; untick Active.

Pricing & terms

Distribution → Pricing & terms

Purpose: A special price and discount for one distributor and product.

How to use it: Add price → distributor, product, net price (before GST), discount %.

Example: Kaveri, MP-200: ₹55.00 with 2% discount → ₹53.90 effective.

Important: Only prefills new orders; existing orders keep their own rates.

Orders

Distribution → Orders → New order

Purpose: Records what a distributor ordered, before any goods are sent.

How to use it: Choose distributor and date → **Add product** and quantity (rate, discount and GST fill in) → **Save as draft** or **Save & confirm**.

Example: 60 Pcs at ₹55 less 2%, IGST 12%: total ₹3,622.08 (not rounded; the invoice rounds to ₹3,622.00).

Important: No stock change on saving or confirming. Exceeding the credit limit only shows a warning ("Confirm anyway"). Statuses Partially dispatched and Dispatched are set automatically by dispatches.

Dispatches (stock allocation)

Distribution → Dispatches → New dispatch

Purpose: Sends goods out and **reduces saleable stock**, choosing the batches.

How to use it: Choose a confirmed order → **Auto-allocate all** (suggests earliest expiry first) or pick batches by hand → decide "Generate invoice after dispatch" → **Record dispatch**.

Example: Dispatch 60 Pcs: all taken from MP-261014-A; stock falls from 100 to 40.

Important: You can dispatch part of an order. A dispatch cannot be edited or cancelled. Warehouse users should untick the invoice box (their role cannot create invoices).

Distributor stock

Distribution → Distributor stock

Purpose: Compares what you dispatched with the sales and remaining stock each distributor **reports**.

How to use it: Add report (or **Import CSV**): distributor, product, month, reported sales, remaining stock.

Example: Dispatched 60, reported sales 35, remaining 20 → 5 units unreconciled.

Important: Reports are information only: they do not move stock or money. "Not reported" means no report was entered.

7. Sales

Payments against invoices are recorded under Accounts → Payments received (section 8).

Invoices

Sales → Invoices → Generate invoice

Purpose: GST tax invoices for dispatched goods. The invoice is what the distributor owes.

How to use it:

1. Normally tick "Generate invoice after dispatch". Otherwise: Invoices → **Generate invoice** → choose the dispatch and date.
2. Open an invoice and use **Print / Save as PDF**.

Example: INV-2026-0001: taxable ₹3,234.00 + IGST ₹388.08, round-off −₹0.08 = ₹3,622.00.

Important: One invoice per dispatch; **stock is not changed** (the dispatch did that). Invoices cannot be edited or deleted; correct with credit/debit notes or returns. Dates cannot be in the future.

How GST is calculated

Per line: quantity × rate, minus the discount, gives the **taxable value**; GST is the taxable value × the product's GST rate. If the **State in Settings** equals the distributor's State the tax is CGST (half) + SGST (half); otherwise it is IGST. The invoice total is rounded to the rupee and the difference is shown as round-off. Example: ₹1,000 at 18% = ₹180 tax → CGST ₹90 + SGST ₹90, or IGST ₹180; total ₹1,180. The system does **not** file GST returns, create e-invoices or e-way bills; the GST summary report is for your accountant.

Sales returns

Sales → Sales returns → Record return

Purpose: Records goods a distributor sends back and decides where each unit goes.

How to use it: Choose distributor and invoice, reason, and the return quantity and **classification** for each line → keep **Issue credit note** ticked → **Record return**.

Example: 5 of 60 Pcs returned damaged: credit note ₹301.84.

Important: See the return table above: only **Saleable** goes back to sellable stock. “Needs inspection” lines get a final **Decide disposition**.

Credit & debit notes

Sales → Credit & debit notes → New note

Purpose: Credit reduces what a distributor owes (price correction, discount); **debit** increases it (extra charge). Returns create their own credit notes.

How to use it: New note → type, date, distributor, optional invoice, amount before GST, GST rate, reason → **Issue note**.

Example: Credit note for a rate difference: ₹100 + 18% = ₹118.00.

Important: Changes the distributor's balance (and the invoice's outstanding if linked). Does not change stock; cannot be edited or deleted.

8. Accounts

This is operational record-keeping, not full double-entry accounting.

Receivables

Accounts → Receivables

Purpose: What each distributor owes, credit used, and which invoices are due or overdue.

How to use it: Tab **Distributor balances** (filters Overdue only, Over limit only) and tab **Due & overdue invoices**; row menu **Record payment**.

Example: Kaveri: invoiced ₹3,622.00, credit notes ₹301.84, received ₹3,320.16 → balance ₹0.00.

Important: Balance = invoices + debit notes − credit notes − all payments. A payment you have not allocated lowers the balance but not any invoice's outstanding.

Payments received

Accounts → Payments received → Record payment

Purpose: Saves money received and **allocates** it to invoices.

How to use it:

1. Choose distributor, date, amount and mode (Cash, Bank transfer, UPI, Cheque, Other).
2. Click **Auto-allocate** (oldest invoice first) or type amounts per invoice → **Record payment**.

Example: ₹2,000 allocated to INV-2026-0001: invoice Partial, ₹1,622.00 outstanding. Over-paying keeps the extra “on account”.

Important: Recording and allocating are separate ideas: only allocation changes an invoice's status. Leftover money can be applied later with **Allocate remaining**. Payments cannot be edited or deleted.

Distributor ledger

Accounts → Distributor ledger

Purpose: One distributor's statement: invoices, payments and notes with a running balance.

How to use it: Choose the distributor and period; use Print or Export CSV.

Example: Invoice +3,622.00 → payment −2,000.00 → credit note −301.84 = 1,320.16.

Important: Read-only. Its final balance equals the Balance on Receivables.

Payables

Accounts → Payables

Purpose: What you owe each supplier (goods receipts − supplier returns − payments), and a place to record supplier payments.

How to use it: Record payment → supplier, date, amount, mode.

Example: Shree Ganesh Foods: ₹4,480.00 owed; pay it → ₹0.00.

Important: A simple supplier-level balance; payments are not matched to individual receipts. Overpaying shows as an advance.

Office expenses

Accounts → Office expenses

Purpose: Records running costs such as rent and electricity, by category.

How to use it: Manage categories first, then **Add expense** (date, category, payee, amount, mode).

Example: Electricity, ₹4,200.00, bank transfer.

Important: Unlike most records, expenses can be edited and deleted. They feed only the Income & expense summary.

Income & expense

Accounts → Income & expense

Purpose: Simple summary: sales (net of credit notes) − purchases − expenses = operating result, all before GST.

How to use it: Choose the period and read the cards, chart and expense table.

Example: Net income ₹2,964.50 − purchases ₹4,000.00 − expenses ₹4,200.00 = −₹5,235.50.

Important: Not a profit-and-loss statement: it uses purchases, not cost of goods sold.

9. Reports

Reports → six pages, all read-only. Choose the **Period** at the top. Revenue means value before GST, net of returns. Click **Export CSV** on any table to open it in Excel (all matching rows; dates are written as text so Excel does not show ####).

Report	What it shows	Useful when
Sales & profitability	Revenue, cost of goods and estimated margin per invoice, plus a monthly trend.	Checking which sales actually earn money.
Brand-wise	Sales, margin and current stock by brand; own brands against external brands.	Deciding which brands to push or stock.
Product performance	Each active product classed High-selling, Average, Slow-moving or Low-performing.	Before reordering or dropping a product.
Distributor performance	Sales, collections, outstanding, returns and reported sales per distributor. Sales are what you invoiced, not what they sold on.	Deciding who to support or chase.
Purchase & sales registers	Invoices and goods receipts in date order with the CGST/SGST/IGST split.	Handing figures to your accountant.
GST summary	Output GST by rate and month, credit/debit-note GST, input GST on purchases.	Month-end GST review (not a filing).

10. Administration

Visible only to administrators by default.

Users

Administration → Users → Add user

Purpose: Creates accounts and decides who can sign in.

How to use it: Enter name, email and **Role** (Administrator, Accounts, Warehouse, Sales) and a password (8+ characters); leave **Active** ticked.

Example: Anita Rao, role Accounts.

Important: To stop someone signing in, untick Active rather than deleting. The last active administrator cannot be removed.

Roles & permissions

Administration → Roles & permissions

Purpose: Sets, per role and per area, **None** (hidden), **View** (read only) or **Edit**.

How to use it: Open a role's tab and click None / View / Edit for each area; it saves immediately.

Example: Give Sales "View" on Purchases.

Important: By default Warehouse can edit Inventory, Purchases and Distribution; Accounts can edit Sales, Receivables, Payables and Expenses; Sales can edit Distributors, Distribution and Sales. The server enforces this.

Audit trail

Administration → Audit trail

Purpose: Read-only history of who did what and when (sign-ins, master data, documents, payments).

How to use it: Search or filter by record type, action, user and period.

Example: "Dispatched 1 batch lines for ORD-2026-0001".

Important: Entries cannot be changed. Choose a period explicitly; the drop-down label can be misleading.

Settings & backup

Administration → Settings & backup (tabs: Company & billing, Inventory, Backup & security)

Purpose: Company name, GSTIN, **State**, default credit days, invoice terms, stock valuation method and the expiry alert window.

How to use it: Edit the fields and click **Save changes**.

Example: State Karnataka; expiry alert window 90 days.

Important: Set the State correctly first: it decides CGST/SGST or IGST on every invoice. **"Run backup now" is simulated** and backs up nothing; arrange real database backups separately.

Things to remember

- Dispatches, invoices, notes, returns, goods receipts, supplier returns, write-offs and payments **cannot be edited or deleted**; correct them with a further entry. Check before you save.
- Many lists open on "Last 6 months". If a record seems missing, change the **Period**.
- After saving, look for the record on its list before repeating the action, to avoid duplicates.
- The system does not file GST returns, and it is not a double-entry accounting package.
